4.1.2 Nonconformance. Failure of the unit to pass any examination or test of this specification shall automatically classify the unit as nonconforming. Each nonconforming unit corrected by the contractor shall be reinspected. Reinspection may be limited to the test or examination which defined the nonconformance, or, when directed by the cognizant inspector, a complete retest and re-examination may be required. Nonconforming units which have not been corrected will be considered for acceptance only upon formal application by the contractor to the cognizant NASA representative.

4.2 TESTS

4.2.1 Drawing Compl[illegible] modules shall be examined for compliance with the requirements of [illegible] Drawing 2003121. Particular attention shall be given to inspection for [illegible], pin misalignments, legibility and appearance of marking, and [illegible] surfaces, structure and equipment.

4.2.2 Thermal Conditio[illegible] [illegible]rify that the module was subjected to two complete thermal cycles as s[illegible]d in paragraph 3.1.1 prior to performing the acceptance tests specified he[illegible]

4.2.3 Insulation Resistance. Using test equipment with a test potential of 50 VDC limited to a short circuit current of 50 microamperes, measure the resistance between all unconnected (spare) pins and all other pins connected together and between pin 401 and all other pins connected together. Verify that the resistance complies with that specified in paragraph 3.1.2.

4.2.4 Continuity. Verify that the resistances measured between connected pins, and between chassis ground pin 401 and chassis comply with that specified in paragraph 3.1.3.

4.2.5 Input-Output. Make 4.0 ± 0.1 VDC connections (connect 0 VDC to chassis ground). Apply logic input program as derived from the Logic Flow Diagrams and read outputs to determine compliance with Paragraph 3.1.3. All gate inputs, singly or in combination, shall be exercised with the outputs monitored and compared to the expectant value. In cases of isolated circuitry, where inputs are not accessible, the combination shall be considered as a chain of logic flow from the input to the output pins of the module. Simulated loading shall be as indicated in Table IV. Perform this test at 25°C.

4.2.6 WORKMANSHIP. The following tests shall be performed under the conditions specified as a verification of good workmanship.

4.2.6.1 Vibration. Install the module in a computer. Subject the computer subsystem to the vibration tests specified in the applicable JDC. Verify that the computer subsystem meets the requirements of the applicable specification.

4.2.6.2 Thermal Extremes and Marginal Voltages. Repeat the Input-Output test as specified in Paragraph 4.2.5 at 0°C and +70°C and at +4.8 VDC and +3.4 VDC to determine compliance with Paragraph 3.1.3. Modules shall be stabilized at thermal extremes for ½ hour minimum before testing.

4.2.6.3 Weight. Weigh the module to the nearest .01 pound. Verify that the weight does not exceed the maximum allowable weight specified in section 3.2.2.

5.0 PREPARATION FOR DELIVERY

5.1 GENERAL. Preparation for delivery shall be in accordance with Specification ND 1002214.

Verify that the resistances measured between pin numbers within the groups 122 and 150, 222 and 250, 322 and 350, 422 and 450, 124 and 148, 224 and 248, 324 and 348, 424 and 448, 112 and 136 and 160, 212 and 236 and 260, 312 and 336 and 360, 412 and 436 and 460.and between chassis ground pin 401 and chassis comply with that specified in paragraph 3.1.3.

4.2.5 Input-Output. Make 4.0 ± 0.1 VDC connections (connect 0 VDC to chassis ground). Apply logic input program as derived from the Logic Flow Diagrams and read outputs to determine compliance with Paragraph 3.1.3. All gate inputs, singly or in combination, shall be exercised with the outputs monitored and compared to the expectant value. In cases of isolated circuitry, where inputs are not accessible, the combination shall be considered as a chain of logic flow from the input to the output pins of the module. Simulated loading shall be as indicated in Table IV. Perform this test at 25°C.

4.2.6 WORKMANSHIP. The following tests shall be performed under the conditions specified as a verification of good workmanship.

4.2.6.1 Vibration. Install the module in a computer. Subject the computer subsystem to the vibration tests specified in the applicable JDC. Verify that the computer subsystem meets the requirements fo the applicable specification.

3.1.13 Marginal Voltage and Temperature Extremes. The module shall perform as described in paragraphs 3.1.8 through 3.1.12 under each of the two combinations (temperature and input voltage) of operating extremes.

3.1.13.1 Low Operating Extreme:

a. Voltage: 4.8 ± 0.1 vdc and 12.2 ± 0.1 vdc

b. Temperature: $-10^{\circ}C\,{}^{+0C^{\circ}}_{-2.8C^{\circ}}$:

Under the low operating extremes the following output (amplitude A) deviations shall apply:

Set and Reset Driver	Clear Driver	Inhibit Driver
Amplitude A = 475 ± 15 ma	Amplitude A = 350 ± 10 ma	Amplitude A = 220 ± 10 ma
Tr $0.6\,{}^{+0.3}_{-0.2}$		

3.1.13.2 High Operating Extreme

a. Voltage: 3.4 ± 0.1 vdc and 16.5 ± 0.1 vdc

b. Temperature: $70^{\circ}C\,{}^{+2.8C^{\circ}}_{-0C^{\circ}}$

Under the high operating extreme the following output (amplitude A) deviations shall apply.

Set and Reset Driver	Clear Driver	Inhibit Driver
Amplitude A = 425 ± 15 ma	Amplitude A = 345 ± 10 ma	Amplitude A = 225 ± 10 ma
[illegible]	Tr $1.3\,{}^{+0.5}_{-0.3}$	
	T off NMT 1.9 us	

ROPE GATE: A_1 NMT 1.8V below B+

NOTE: Input high amplitudes will not be within the room temperature limits.

3.1.13.3 Inhibit and Clear Drivers Outputs Under Low Conditions. With input voltages of 3.4 ± 0.1 vdc and 16.5 ± 0.1 vdc and with an ambient temperature of $-10\ C\,{}^{+0^{\circ}C}_{-2.9^{\circ}C}$ amplitude A for the inhibit drivers shall be 255 ± 10 ma and for the clear drivers shall be 380 ± 10 ma.

3.1.13.4 Inhibit and Clear Drivers Outputs Under High Conditions. With input voltages of 4.8 ± 0.1 vdc and 12.2 ± 0.1 vdc and in an ambient temperature of 70°C amplitude A for inhibit drivers shall be 190 ± 10 ma and for the clear drivers shall be 315 ± 10 ma.

3.1.14 Vibration. The module shall perform as specified in paragraphs 3.1.8 through 3.1.12 when installed in an operating computer which is being subjected to the vibration requirements specified in the applicable specifications for the computer subsystem. Acceptance criteria for the module shall be compliance of the computer subsystem with its applicable specifications.

3.1.13 **Marginal Voltage and Temperature Extremes.** The module shall perform as described in paragraphs 3.1.8 through 3.1.12 under each of the two combinations (temperature and input voltage) of operating extremes.

3.1.13.1 **Low Operating Extreme:**

a. **Voltage:** 4.8 ± 0.1 vdc and 12.2 ± 0.1 vdc

b. **Temperature:** $-10^{\circ}C\,^{+0C^{\circ}}_{-2.8C^{\circ}}$;

Under the low operating extremes the following output (amplitude A) deviations shall apply:

Set and Reset Driver	Clear Driver	Inhibit Driver
Amplitude A = 475 ± 15 ma	Amplitude A = 345 ± 10 ma	Amplitude A = 220 ± 10 ma
Tr $0.6\,^{+0.3}_{-0.2}$		

3.1.13.2 **High Operating Extreme**

a. **Voltage:** 3.4 ± 0.1 vdc and 16.5 ± 0.1 vdc

b. **Temperature:** $70^{\circ}C\,^{+2.8C^{\circ}}_{-0C^{\circ}}$

Under the high operating extreme the following output (amplitude A) deviations shall apply.

Set and Reset Driver	Clear Driver	Inhibit Driver
Amplitude A = 425 ± 15 ma	Amplitude A = 350 ± 10 ma	Amplitude A = 225 ± 10 ma

ROPE GATE: A_1 NMT 1.8V below B+

NOTE: Input high amplitudes will not be within the room temperature limits.

3.1.13.3 **Inhibit and Clear Drivers Outputs Under Low Conditions.** With input voltages of 3.4 ± 0.1 vdc and 16.5 ± 0.1 vdc and with an ambient temperature of $-10\,C\,^{+0^{\circ}C}_{-2.8^{\circ}C}$ amplitude A for the inhibit drivers shall be 255 ± 10 ma and for the clear drivers shall be 375 ± 10 ma.

3.1.13.4 **Inhibit and Clear Drivers Outputs Under High Conditions.** With input voltages of 4.8 ± 0.1 vdc and 12.2 ± 0.1 vdc and in an ambient temperature of 70°C amplitude A for inhibit drivers shall be 190 ± 10 ma and for the clear drivers shall be 320 ± 10 ma.

3.1.14 **Vibration.** The module shall perform as specified in paragraphs 3.1.8 through 3.1.12 when installed in an operating computer which is being subjected to the vibration requirements specified in the applicable specifications for the computer subsystem. Acceptance criteria for the module shall be compliance of the computer subsystem with its applicable specifications.

Copies of Specifications, Standards, Drawings, Bulletins and Publications required by suppliers in connection with specific procurement functions should be obtained from the Procuring Activity or as directed by the Contracting Officer.

2.2 CONFLICTING REQUIREMENTS. In the event of conflict between the requirements of the contract, this Specification and the documents listed in this section, the following order of precedence shall apply and the contractor shall notify MIT Apollo Management of the conflict as soon as it is determined.

a. The contract
b. This Specification
c. Documents listed in this section

3.1.11 **Clear Driver.** The input and output waveforms shall comply with Table 3-5 and Figure 3-2 with the output measured across the output load resistor. The amplitude (A) limit has been established for an ambient temperature of 25°C.

Table 3-5

Parameter	Input	Output
Level (A_2) low	0.8 ± 0.1 volt	2.0 ma, max
Level (A_1) high	2.1 ± 0.25 volts	--------
Amplitude (A)	--------	350 ± 5 ma*
Rise Time (T_r)	100 nsec max	1.3 ± 0.3 usec
Fall Time (T_f)	100 nsec max	--------
Pulse Width (PW)	4 usec ± 5%	--------
Period (T)	32 usec ± 5%	--------
TD	--------	0.20 usec max
T OFF	--------	1.75 usec max

* at 25°C

3.1.13 **Marginal Voltage and Temperature Extremes.** The module shall perform as described in paragraphs 3.1.8 through 3.1.12 under each of the two combinations (temperature and input voltage) of operating extremes.

3.1.13.1 **Low Operating Extreme:**

a. **Voltage:** 4.8 ± 0.1 vdc and 12.2 ± 0.1 vdc

b. **Temperature:** $-10^\circ C\ ^{+0C^\circ}_{-2.8C^\circ}$:

Under the low operating extremes the following output (amplitude A) deviations shall apply:

Set and Reset Driver	Clear Driver	Inhibit Driver
Amplitude A = 475 ± 15 ma Tr $0.6^{+0.3}_{-0.2}$	Amplitude A = 350 ± 10 ma	Amplitude A = 220 ± 10 ma

3.1.13.2 **High Operating Extreme**

a. **Voltage:** 3.4 ± 0.1 vdc and 16.5 ± 0.1 vdc

b. **Temperature:** $70^\circ C\ ^{+2.8C^\circ}_{-0C^\circ}$

Under the high operating extreme the following output (amplitude A) deviations shall apply.

Set and Reset Driver	Clear Driver	Inhibit Driver
Amplitude A = 425 ± 15 ma [illegible]	Amplitude A = 350 ± 10 ma Tr $1.3^{+0.5}_{-0.3}$ T off NMT 1.9 us	Amplitude A = 225 ± 10 ma

ROPE GATE: A_1 NMT 1.8V below B+

NOTE: Input high amplitudes will not be within the room temperature limits.

3.1.13.3 Inhibit and Clear Drivers Outputs Under Low Conditions. With input voltages of 3.4 ± 0.1 vdc and 16.5 ± 0.1 vdc and with an ambient temperature of $-10\ C\ ^{+0^\circ C}_{-2.8^\circ C}$ amplitude A for the inhibit drivers shall be 255 ± 10 ma and for the clear drivers shall be 379 ± 10 ma.

3.1.13.4 Inhibit and Clear Drivers Outputs Under High Conditions. With input voltages of 4.8 ± 0.1 vdc and 12.2 ± 0.1 vdc and in an ambient temperature of 70°C amplitude A for inhibit drivers shall be 190 ± 10 ma and for the clear drivers shall be 329 ± 10 ma.

3.1.14 **Vibration.** The module shall perform as specified in paragraphs 3.1.8 through 3.1.12 when installed in an operating computer which is being subjected to the vibration requirements specified in the applicable specifications for the computer subsystem. Acceptance criteria for the module shall be compliance of the computer subsystem with its applicable specifications.

3.1.13 **Marginal Voltage and Temperature Extremes.** The module shall perform as described in paragraphs 3.1.8 through 3.1.12 under each of the two combinations (temperature and input voltage) of operating extremes.

3.1.13.1 Low Operating Extreme:

a. Voltage: 4.8 ± 0.1 vdc and 12.2 ± 0.1 vdc

b. Temperature: $-10^{\circ}C{}^{+0C^{\circ}}_{-2.8C^{\circ}}$:

Under the low operating extremes the following output (amplitude A) deviations shall apply:

Set and Reset Driver	Clear Driver	Inhibit Driver
Amplitude A = 475 ± 15 ma	Amplitude A = 350 ± 10 ma	Amplitude A = 220 ± 10 ma
Tr $0.6{}^{+0.3}_{-0.2}$		

3.1.13.2 High Operating Extreme

a. Voltage: 3.4 ± 0.1 vdc and 16.5 ± 0.1 vdc

b. Temperature: $70^{\circ}C{}^{+2.8C^{\circ}}_{-0C^{\circ}}$

Under the high operating extreme the following output (amplitude A) deviations shall apply.

Set and Reset Driver	Clear Driver	Inhibit Driver
Amplitude A = 425 ± 15 ma	Amplitude A = 350 ± 10 ma	Amplitude A = 225 ± 10 ma
[illegible]	Tr $1.3{}^{+0.6}_{-0.3}$ usec.	
	T off NMT 1.9 us	

ROPE GATE: A_1 NMT 1.8V below B+

NOTE: Input high amplitudes will not be within the room temperature limits.

3.1.13.3 Inhibit and Clear Drivers Outputs Under Low Conditions. With input voltages of 3.4 ± 0.1 vdc and 16.5 ± 0.1 vdc and with an ambient temperature of $-10\,C{}^{+0^{\circ}C}_{-2.8^{\circ}C}$ amplitude A for the inhibit drivers shall be 255 ± 10 ma and for the clear drivers shall be 370 ± 10 ma.

3.1.13.4 Inhibit and Clear Drivers Outputs Under High Conditions. With input voltages of 4.8 ± 0.1 vdc and 12.2 ± 0.1 vdc and in an ambient temperature of 70°C amplitude A for inhibit drivers shall be 190 ± 10 ma and for the clear drivers shall be 320 ± 10 ma.

3.1.14 **Vibration.** The module shall perform as specified in paragraphs 3.1.8 through 3.1.12 when installed in an operating computer which is being subjected to the vibration requirements specified in the applicable specifications for the computer subsystem. Acceptance criteria for the module shall be compliance of the computer subsystem with its applicable specifications.

3.1.13 Marginal Voltage and Temperature Extremes. The module shall perform as described in paragraphs 3.1.8 through 3.1.12 under each of the two combinations (temperature and input voltage) of operating extremes.

3.1.13.1 Low Operating Extreme:

a. Voltage: 4.8 ± 0.1 vdc and 12.2 ± 0.1 vdc

b. Temperature: $-10^{\circ}C\ ^{+0C^{\circ}}_{-2.8C^{\circ}}$

Under the low operating extremes the following output (amplitude A) deviations shall apply:

Set and Reset Driver	Clear Driver	Inhibit Driver
Amplitude A = 475 ± 15 ma	Amplitude A = 350 ± 15 ma	Amplitude A = 220 ± 10 ma
$Tr\ 0.6\ ^{+0.3}_{-0.2}$		

3.1.13.2 High Operating Extreme

a. Voltage: 3.4 ± 0.1 vdc and 16.5 ± 0.1 vdc

b. Temperature: $70^{\circ}C\ ^{+2.8C^{\circ}}_{-0C^{\circ}}$

Under the high operating extreme the following output (amplitude A) deviations shall apply.

Set and Reset Driver	Clear Driver	Inhibit Driver
Amplitude A = 425 ± 15 ma	Amplitude A = 350 ± 15 ma	Amplitude A = 225 ± 10 ma
	$Tr\ 1.3\ ^{+0.6}_{-0.3}$ usec.	
	T off NMT 1.9 us	

ROPE GATE: A_1 NMT 1.8V below B+

NOTE: Input high amplitudes will not be within the room temperature limits.

3.1.13.3 Inhibit and Clear Drivers Outputs Under Low Conditions. With input voltages of 3.4 ± 0.1 vdc and 16.5 ± 0.1 vdc and with an ambient temperature of $-10\ C\ ^{+0^{\circ}C}_{-2.8^{\circ}C}$ amplitude A for the inhibit drivers shall be 255 ± 10 ma and for the clear drivers shall be 370 ± 15 ma.

3.1.13.4 Inhibit and Clear Drivers Outputs Under High Conditions. With input voltages of 4.8 ± 0.1 vdc and 12.2 ± 0.1 vdc and in an ambient temperature of 70°C amplitude A for inhibit drivers shall be 190 ± 10 ma and for the clear drivers shall be 325 ± 15 ma.

3.1.14 Vibration. The module shall perform as specified in paragraphs 3.1.8 through 3.1.12 when installed in an operating computer which is being subjected to the vibration requirements specified in the applicable specifications for the computer subsystem. Acceptance criteria for the module shall be compliance of the computer subsystem with its applicable specifications.

4.2.4.4 Set and Reset Drivers. Verify that the input and output waveforms complies with paragraph 3.1.10. The input waveforms shall be applied to pins 125, 212 and 224. The outputs shall be measured across 10-ohm ± 0.1% load resistor connected between the output pins (108, 123 and 227) and B+ (high). The input pins shall be returned to not more than 0.9 vdc when no input pulse is being applied.

4.2.4.5 Clear Driver. Verify that the input and output pulses complies with paragraph 3.1.11. The input shall be applied to pin 104. The output shall be measured across 10-ohm ± 0.1% resistors connected from the output pins (206 and 207) and high B+. Inputs shall be terminated to not more than 0.9 vdc when not being tested.

4.2.4.6 Rope Gates. Verify that the input and output pulses complies with paragraph 3.1.12. The input pulses shall be applied to module pins 144, 137 and 213. The output measurements shall be made across the 31 ohms ± 1% load resistors connected between the output pins (237, 118, 149, 139, 127, 222, 113, 252 and 238) and ground. The input-output pin association is as follows:

149, 238 and 252 and associated with 144

113, 118 and 222 associated with 213

127, 139 and 237 associated with 137

4.2.5 Weight. Weigh the module to the nearest .01 pound. Verify that the weight does not exceed the maximum allowable weight specified in paragraph 3.2.2.

4.3 WORKMANSHIP. The following tests shall be performed under the conditions specified as a verification of good workmanship.

4.3.1 Marginal Voltage and Temperature Extremes. The module shall perform without degradation in performance when subjected to the temperature and voltage combinations specified in paragraph 3.1.13. There shall be an exception to the performance requirements in those instances (in section 3) where a specific ambient temperature of 25°C has been specified as a criteria for achieving the specified results. The module shall be subjected to the tests specified in paragraphs 4.2.4.2 through 4.2.4.6 in the high and low (voltage and temperature) environments. The module shall be exposed to its test temperature for at least 30 minutes prior to test.

4.3.2 Vibration. Install the module in an applicable computer. Subject the computer subsystem to the vibration tests specified in the applicable JDC. Verify that the computer subsystem meets the requirements of the applicable specification.

5. PREPARATION FOR DELIVERY

Set and Reset Driver	Clear Driver	Inhibit Driver
Amplitude A = 425 ± 15 ma	Amplitude A = 345 ± 10 ma	Amplitude A = 225 ± 10 ma

3.1.13.3 **Inhibit and Clear Drivers Outputs Under Low Conditions.** With input voltages of 3.4 ± 0.1 vdc and 16.5 ± 0.1 vdc and with an ambient temperature of $-10\ C\ ^{+0^{\circ}C}_{-2.9^{\circ}C}$ amplitude A for the inhibit drivers shall be 255 ± 10 ma and for the clear drivers shall be 380 ± 10 ma.

3.1.13.4 **Inhibit and Clear Drivers Outputs Under High Conditions.** With input voltages of 4.8 ± 0.1 vdc and 12.2 ± 0.1 vdc and in an ambient temperature of 70°C amplitude A for inhibit drivers shall be 190 ± 10 ma and for the clear drivers shall be 315 ± 10 ma.

3.1.14 **Vibration.** The module shall perform as specified in paragraphs 3.1.8 through 3.1.12 when installed in an operating computer which is being subjected to the vibration requirements specified in the applicable specifications for the computer subsystem. Acceptance criteria for the module shall be compliance of the computer subsystem with its applicable specifications.

3.2 Product Configuration

3.2.1 **Drawings.** The configuration of the assembly shall be in accordance with APOLLO G&N Drawing 2003140 and all drawings and engineering data referenced thereon.

3.2.2 **Weight.** Maximum allowable weight of the assembly shall be 0.90 pounds.

4. QUALTIY ASSURANCE PROVISION

4.1 **GENERAL.** The contractor responsible for the manufacture of the assembly shall be responsible for the accomplishment of each test required herein. A cross reference index of module requirements (section 3) and verification tests for these requirements (section 4) is provided in Table 4-1.

4.2.4 Dynamic Tests

4.2.4.1 Test Conditions. The input pulses shall be applied to the module from a micrologic as specified in figure 4-1. The following conditions shall be maintained throughout dynamic tests unless otherwise specified. The input DC levels shall be adjusted before applying power to the module.

a. Pins 169, 101, 103, 111, 218, 235, 254, 259, and 265 shall be connected to ground (0.VDC).

b. Pins 102, 154, 165, 239 and 240 shall be connected to 14.0 ± 0.1 VDC (high B+).

c. Pins 255 and 266 shall be connected to 4.0 ± 0.1 VDC (low B+).

4.2.4.2 Inhibit Gates. Verify that the input and output waveforms complies with paragraph 3.1.8. The input shall be applied to pin 249. The output shall be measured across a 50-ohm, ± 5%, loading resistor connected between pin 244 and 0 VDC. Pins 104, 125, 224 and 212 shall be terminated to not more than 0.9 vdc. Inputs shall be terminated to not more than 0.9 vdc when not being used.

4.2.4.3 Inhibit Drivers. Verify that the input and output waveforms complies with paragraph 3.1.9. See table 4-2 for input and output pin relationships and for pin A and B locations. The following connections shall be made.

a. Pins 104, 125, 224 and 212 shall be grounded.

b. Connect pin 260 to a potential of 1.7 ± 0.2 volts below B+ high.

c. Connect 10- ohm ± 0.1% load resistors between pin B (see table 4-2) and B+ (high).

3.1.4 Vibration. With power applied the module shall perform as specified herein when subjected to vibration limits specified below:

Frequency Range:	10 to 2000 to 10 cps
Frequency Sweep Rate:	at a logarithmic rate of one minute per octave.
Velocity:	3.14 ± 10% inches per second in the frequency range of 10 to 100 cps.
Acceleration:	5 g's ± 10% peak in the frequency range of 100 to 2000 cps.

3.2 PRODUCT CONFIGURATION

3.2.1 Drawings. The configuration of the module shall be in accordance with APOLLO G&N Drawing 2003887 and all drawings and engineering data referenced thereon.

3.2.2 Weight: Maximum weight of the module shall be 1.68 pounds.

4. QUALITY ASSURANCE PROVISIONS

4.1 GENERAL. The contractor responsible for the manufacture of the module shall be responsible for the accomplishment of each test required. The cross reference index (Table 4-1) shows the relationship between the performance requirements in section 3 and verification of those requirements in section 4.

4.2.2.2.11.1 Repeat test 4.2.2.2.11 part b. with the sync pulse applied to terminal 205. (3.1.2.9b).

4.2.2.2.12 **14V (A30) Voltage Control Test.** Apply the conditions as specified in Figure 1 with a supply voltage of 28 ± 0.2 VDC. Apply the 14V conditions as specified in Figure 4 to terminal 204. Vary the 2.5K POT over its entire range while monitoring the 14 volt outputs (Figure 1) for a range of 9.0 ± 0.5 vdc to 17.0 ± 0.2 vdc. (3.1.2.10a).

4.2.2.2.13 14V (A31) ACE Test 1. Apply the conditions as specified in Figure 1 with a supply voltage of 28 ± 0.2 VDC. Apply the conditions as specified in Figure 5 to terminal 103 and switching S1 and holding S2 OFF while monitoring the 14 volt outputs (Figure 1) for a minimum range of 10.1 ± 0.2 VDC to 17.0 ± 0.2 VDC. (3.1.2.10b).

> NOTE: V Out vs ACE Voltage Data shall be recorded with ACE Voltage varied at increments of 2 volts to +10 volts and -10 volts, and 5 volts from 10 to 30 vdc and -10 to -30 vdc.

4.2.2.2.14 ACE Test Number 2. With the ACE test conditions applied and by switching S2 to ground and S1 OFF as described in Figure 5, the 14 volt output shall be 12.8 ± 0.4 vdc. (3.1.2.10c).

4.2.3 Weight. Weigh the module to the nearest .01 pound. Verify that the weight does not exceed the maximum allowable weight specified in paragraph 3.2.2.

4.3 Workmanship. The following tests shall be performed under the conditions specified as a verification of good workmanship.

4.3.1 Marginal Voltage and Temperature Extremes. The module shall be exposed to its ambient temperature for at least 30 minutes prior to starting electrical tests in the temperature extremes described in paragraph 3.1.3. The module shall be tested only in accordance with paragraph 4.2.2.2.1 through 4.2.2.2.3; 4.2.2.2.9 through 4.2.2.2.10 and 4.2.2.2.15. The tests described in these paragraphs incorporate the voltage extremes described in paragraph 3.1.3. The following exceptions shall apply:

The cross reference index (Table 4-1) shows the relationship between the performance requirements in section 3 and verification of those requirements in section 4.

4.2.2.2 Dynamic Tests.

4.2.2.2.1 4V Supply (A30) Regulation, Ripple, Noise, and Control Pulse Tests. Perform tests as listed in Table I to assure that the requirements for the parameters of regulation, ripple, noise (switching spikes), and control pulse are as specified in 3.1.2.1 through 3.1.2.3.1.

4.2.2.2.2 4V (A30) Transient Response Test.

a. (Low Input). Apply the conditions as specified in Figure 1 with a supply voltage of 17.9 ± 0.1. Monitor the low load output (Figure 1) for a waveform (Figure 8) having a recovery time of not more than 4.0 msec, an overshoot of not more than 3.5 Vpk, and an under shoot of not more than 1.0 Vpk after the application of each condition listed below. (3.1.2.2e).

   (1) Step load (amperes) from 0.50 ± 0.05 to 6.8 ± 0.3 and from 6.8 ± 0.3 to 0.50 ± 0.05 at an 8-12 cps rate.

b. (High Input). Repeat test a. above using a supply voltage of 36.2 ± 0.2 (in place of 17.9 ± 0.1). Monitor the low load output for a recovery time of not more than 8.0 msec, an overshoot of not more than 4.5 Vpk and an under shoot of not more than 1.0 Vpk. (3.1.2.3e).

4.2.2.2.3 Standby Relay Test. Apply the conditions as specified in Figure 1 with a supply of 36.2 ± 0.2 VDC. Monitor the 4 volt output for a high load current of 6.8 ± 0.3 amperes and a low load current of 0.50 ± 0.05 amperes, and:

a. Energize the relay by applying the conditions described in Figure 3 and monitor SBYREL/voltage which shall be NMT 0.4 volts, the high load current for zero amperes and the output voltage at pin 116 shall be less than 0.1 vdc in accordance with 3.1.2.7a.

*Full Load, wherever designated, is the application of both the EV250 and EVH11 loads.

**Variable from 0 to the values shown by varying the external potentiometer from minimum to maximum resistance.

***25 VDC Source Current, with the 10K potentiometer at max resistance, shall be NMT 75 milliamperes at NO LOAD and NMT 160 ma at FULL LOAD when measured at nominal input voltage at 25°C, -10°C, and +80°C.

4.2 TESTS/VERIFICATION

4.2.1 Drawing Compliance. The modules shall be examined for compliance with the requirements of APOLLO G&N Drawing 2003901. Particular attention shall be given to inspection for contaminants, pin misalignment, legibility and appearance of marking, and damage to surfaces, structure and equipment.

4.2.2 Thermal Conditioning. Verify that the module was subjected to two complete thermal cycles as specified in 3.1.1 prior to performing the acceptance tests specified herein.

4.2.3 Insulation Resistance. Using test equipment with a test potential of 500 VDC limited to a short circuit current of 1.0 milliampere, measure the resistance between pin 1 and all other pins connected together. Verify that the resistance complies with that specified in paragraph 3.1.2.

4.2.4 Isolation Resistance. Using test equipment with a test potential of 500 VDC limited to a short circuit current of 1 milliampere, measure the resistance between pins 2, 3, 5, 7, 9, 11, and 12 connected together and pins 4, 6, 8, and 10 connected together to determine compliance with paragraph 3.1.3

4.2.5 Inputs-Outputs. Apply the input voltage and input signal with the load and input impedance connections as shown in Figure 1. Measure the output at points indicated to determine compliance with Table I at 25°C.

4.2.6 Pin to Pin. Measure the resistance between Pins 3 and 7, 4 and 8, 6 and 10, and 9 and 12 to determine compliance with Paragraph 3.1.5.

4.2.7 Continuity. Verify that the resistance measured between chassis ground pin 1 and the chassis complies with that specified in Paragraph 3.1.4. Anodizing may be penetrated to assure good electrical connection.

4.2.8 Workmanship. The following tests shall be performed under the conditions specified as a verification of good workmanship.

4.2.8.1 Vibration. Install the module in DSKY. Subject the DSKY to the vibration tests specified in paragraph 3.1.8. Verify that the DSKY meets the requirements of the applicable specification.

4.2.8.2 Thermal Extremes and Marginal Voltages. Repeat the test of Paragraph 4.2.5 at -10°C +0, -2.8°C and +80°C -0, +2.8°C to determine compliance with Table I. Modules shall be stabilized at thermal extremes for ½ hour before testing.

4.2.8.3 Weight. Weigh the module to the nearest .01 pound. Verify that the weight does not exceed the maximum allowable weight specified in paragraph 3.2.2.

5.0 PREPARATION FOR DELIVERY

5.1 Preparation for delivery shall be in accordance with Specification ND 1002214.

3.0 REQUIREMENTS

3.1 PERFORMANCE. The Power Supply Module (D7) consists of a load-regulated push-pull amplifier. The circuitry is such that when an 8 volt (nominal) 800 cps square wave input is filtered and amplified, an open circuit output of 250 VRMS (nominal) at 800 cps is obtained.

3.1.1 Thermal Conditioning. The module shall be subjected to two complete thermal cycles, as specified below prior to acceptance testing:

> 25°C down to -10°C ± 3.0°C in NLT 20 minutes, held at -10°C ± 3.0°C for NLT 30 minutes, raised to +70°C ± 3.0°C in NLT 40 minutes, held at +70°C ± 3.0°C for NLT 30 minutes, lowered to 25°C in NLT 20 minutes.

3.1.2 Insulation Resistance. The insulation resistance between chassis ground pin 1 and all other pins connected together shall be 100 megohms minimum.

3.1.4 Continuity. The resistance between the chassis ground pin 1 and the chassis shall be 0.5 ohms maximum.

3.1.5 Pin To Pin Resistance. All pins not mutually insulated shall exhibit the resistance values shown on the unit schematic.

Reference Values: Pins 3 and 7; 1.0K ± 2%; Pins 9 and 12, 10K ± 2%
Pins 4 and 8, 20K ± 2%; Pins 6 and 10, 11K ± 2%

3.1.6 Input Voltages. The module shall function within the limits specified in Table I when supplied with the DC voltage (nominal and marginal), the proper input signal, and the attenuation of a 10K potentiometer as specified in Figure 1.

3.1.7 Load and Output Characteristics. The module shall develop the output voltages specified in Table I when operated into the equivalent loads specified in Figure 1.

3.1.8 The module shall perform as specified in 3.1.6 and 3.1.7 when installed in an operating DSKY which is being subjected to the vibration requirements specified in the applicable specifications for the DSKY. Acceptance criteria for the module shall be the compliance of the DSKY with its applicable specifications.

3.2 PRODUCT CONFIGURATION

3.2.1 DRAWINGS. The module configuration shall be in accordance with APOLLO G&N Drawing 2003901 and all drawings and engineering data referenced thereon.

3.0 REQUIREMENTS

3.1 PERFORMANCE. The Power Supply Module (D7) consists of a load-regulated push-pull amplifier. The circuitry is such that when an 8 volt (nominal) 800 cps square wave input is filtered and amplified, an open circuit output of 250 VRMS (nominal) at 800 cps is obtained.

3.1.1 Thermal Conditioning. The module shall be subjected to two complete thermal cycles, as specified below prior to acceptance testing:

> 25°C down to -10°C ± 3.0°C in NLT 20 minutes, held at -10°C ± 3.0°C for NLT 30 minutes, raised to +70°C ± 3.0°C in NLT 40 minutes, held at +70°C ± 3.0°C for NLT 30 minutes, lowered to 25°C in NLT 20 minutes.

3.1.2 Insulation Resistance. The insulation resistance between chassis ground pin 1 and all other pins connected together shall be 100 megohms minimum.

3.1.3 Isolation Resistance. The isolation resistance between pins 4, 6, 8, and 10 connected together and pins 2, 3, 5, 7, 9, 11, and 12 connected together shall be not less than 100 megohms.

3.1.4 Continuity. The resistance between the chassis ground pin 1 and the chassis shall be 0.5 ohms maximum.

3.1.5 Pin To Pin Resistance. All pins not mutually insulated shall exhibit the resistance values shown on the unit schematic.

Reference Values: Pins 3 and 7; 1.0K ± 2%; Pins 9 and 12, 10K ± 2%
Pins 4 and 8, 20K ± 2%; Pins 6 and 10, 11K ± 2%

3.1.6 Input Voltages. The module shall function within the limits specified in Table I when supplied with the DC voltage (nominal and marginal), the proper input signal, and the attenuation of a 10K potentiometer as specified in Figure 1.

3.1.7 Load and Output Characteristics. The module shall develop the output voltages specified in Table I when operated into the equivalent loads specified in Figure 1.

3.1.8 The module shall perform as specified in 3.1.6 and 3.1.7 when installed in an operating DSKY which is being subjected to the vibration requirements specified in the applicable specifications for the DSKY. Acceptance criteria for the module shall be the compliance of the DSKY with its applicable specifications.

3.2 PRODUCT CONFIGURATION

3.2.1 DRAWINGS. The module configuration shall be in accordance with APOLLO G&N Drawing 2003901 and all drawings and engineering data referenced thereon.

3.2.2 Weight. Maximum allowable weight of the module shall be 0.90 pounds.

*Full Load, wherever designated, is the application of both the EV250 and EVH11 loads.

**Variable from 0 to the values shown by varying the external potentiometer from minimum to maximum resistance.

***25 VDC Source Current, with the 10K potentiometer at max resistance, shall be NMT 75 milliamperes at NO LOAD and NMT 160 ma at FULL LOAD when measured at nominal input voltage at 25°C.

4.2 TESTS/VERIFICATION

4.2.1 Drawing Compliance. The modules shall be examined for compliance with the requirements of APOLLO G&N Drawing 2003901. Particular attention shall be given to inspection for contaminants, pin misalignment, legibility and appearance of marking, and damage to surfaces, structure and equipment.

4.2.2 Thermal Conditioning. Verify that the module was subjected to two complete thermal cycles as specified in 3.1.1 prior to performing the acceptance tests specified herein.

4.2.3 Insulation Resistance. Using test equipment with a test potential of 500 VDC limited to a short circuit current of 1.0 milliampere, measure the resistance between pin 1 and all other pins connected together. Verify that the resistance complies with that specified in paragraph 3.1.2.

4.2.4 Isolation Resistance. Using test equipment with a test potential of 500 VDC limited to a short circuit current of 1 milliampere, measure the resistance between pins 2, 3, 5, 7, 9, 11, and 12 connected together and pins 4, 6, 8, and 10 connected together to determine compliance with paragraph 3.1.3

4.2.5 Inputs-Outputs. Apply the input voltage and input signal with the load and input impedance connections as shown in Figure 1. Measure the output at points indicated to determine compliance with Table I at 25°C.

4.2.6 Pin to Pin. Measure the resistance between Pins 3 and 7, 4 and 8, 6 and 10, and 9 and 12 to determine compliance with Paragraph 3.1.5.

4.2.7 Continuity. Verify that the resistance measured between chassis ground pin 1 and the chassis complies with that specified in Paragraph 3.1.4.

4.2.8 Workmanship. The following tests shall be performed under the conditions specified as a verification of good workmanship.

4.2.8.1 Vibration. Install the module in DSKY. Subject the DSKY to the vibration tests specified in paragraph 3.1.8. Verify that the DSKY meets the requirements of the applicable specification.

4.2.8.2 Thermal Extremes and Marginal Voltages. Repeat the test of Paragraph 4.2.5 at -10°C +0, -2.8°C and +80°C -0, +2.8°C to determine compliance with Table I. Modules shall be stabilized at thermal extremes for ½ hour before testing.

4.2.8.3 Weight. Weigh the module to the nearest .01 pound. Verify that the weight does not exceed the maximum allowable weight specified in paragraph 3.2.2.

5.0 PREPARATION FOR DELIVERY

5.1 Preparation for delivery shall be in accordance with Specification ND 1002214.

The voltage specified in paragraph 3.1.7.3 may deviate to not more than 7.0 VDC.

3.1.9 Vibration. The module shall perform as specified in paragraph 3.1.7 when subjected to the vibration limits specified below:

a. Frequency Range - 10 to 2000 to 10 cps.

b. Frequency Sweep Rate - at a logarithmic rate of one minute per octave.

c. Velocity - 3.14 ± 10% inches per second in the frequency range of 10 to 100 cps.

d. Acceleration - 5 g's ± 10% peak in the frequency range of 100 to 2000 cps.

e. Planes - each of the three mutually perpendicular axes.

(Copies of Specifications, Standards, Drawings, Bulletins and Publications required by suppliers in connection with specific procurement functions should be obtained from the Procuring Activity or as directed by the Contracting Officer).

2.2 Conflicting Requirements. In the event of conflict between the requirements of the contract, this Specification and the documents listed in this section, the following order of precedence shall apply and the contractor shall notify MIT Apollo Management of the conflict as soon as it is determined.

a. The contract
b. This Specification
c. Documents listed in this section.

3.1.7.3 Leakage Test. The voltage monitored at the module input pins shall be not more than 2.0 VDC, when 14.0 ± 0.1 VDC is applied to all output pins, and the input pins are loaded as specified in paragraph 4.2.8.2.

3.1.8 Thermal. The module shall perform as specified in paragraph 3.1.7 when the ambient temperature is set to $-10^{\circ}{}^{+0^{\circ}C}_{-2.8^{\circ}C}$ and $80^{\circ}{}^{+2.8^{\circ}C}_{-0^{\circ}C}$. The voltage specified in paragraph 3.1.7.3 may deviate to not more than 7.0 VDC.

3.1.9 Vibration. The module shall perform as specified in paragraph 3.1.7 when subjected to the vibration limits specified below:

a. Frequency Range - 10 to 2000 to 10 cps.

b. Frequency Sweep Rate - at a logarithmic rate of one minute per octave.

c. Velocity - 3.14 ± 10% inches per second in the frequency range of 10 to 100 cps.

d. Acceleration - 5 g's ± 10% peak in the frequency range of 100 to 2000 cps.

e. Planes - each of the three mutually perpendicular axes.

3.2 PRODUCT CONFIGURATION

3.2.1 Drawings. The configuration of the module shall be in accordance with Apollo G&N Drawing 2003909 and all drawings and engineering data referenced thereon.

3.2.2 Weight. Maximum allowable weight of the module shall be 0.20 pounds.

4. QUALITY ASSURANCE PROVISIONS

4.1 GENERAL. The contractor responsible for the manufacture of the assembly shall be responsible for the accomplishment of each test required herein. See Table 4-1, Product Performance and Configuration Requirement/Quality Verification Cross Reference Index.

TABLE 4-1

Requirement	Verification	Requirement	Verification
3.1.1	4.2.2	3.1.7	4.2.8
3.1.2	4.2.3	3.1.7.3	4.2.8.3
3.1.3	4.2.4	3.1.8	4.3.1
3.1.4	4.2.5	3.1.9	4.3.2
3.1.5	4.2.6	3.2.2	4.3.3
3.1.6	4.2.7		

4.2.6 Resistance. Verify that the resistance measured between the designated module pins shall be as specified in paragraph 3.1.5.

4.2.7 Input Voltage. The input voltage specified in paragraph 3.1.6 shall be applied as detailed in paragraph 4.2.8.

4.2.8 Module Outputs. Apply the power specified in paragraph 4.2.7 to the module input pins as specified in paragraph 3.1.7. Verify that the outputs, monitored at the module output pins listed in Table 3-1, shall be a combination of logic "ones" and "zeros" as specified in paragraph 3.1.7.

4.2.8.1 Output Loads. A 510-ohm ± 5% resistance shall be connected between each output pin listed in Table 3-1 and 0 VDC.

4.2.8.2 Input Loads. A 1.0 megohm ± 5% resistance shall be connected between each input pin listed in Table 3-1 and 0 VDC.

4.2.8.3 Leakage Test. Verify that the voltage measured at the input pins shall be as specified in paragraph 3.1.7.3.

4.3 WORKMANSHIP. The following tests shall be performed under the conditions specified as a verification of good workmanship.

4.3.1 Thermal. Verify that the module shall perform as specified in paragraph 3.1.7 when the ambient temperature is set to the limits specified in paragraph 3.1.8. The module shall be subjected to the designated temperatures for one-half hour prior to performing any electrical tests.

4.3.2 Vibration. Subject the module to the vibration test specified in paragraph 3.1.9. Verify that the module performs in accordance with paragraph 3.1.9.

4.3.3 Weight. Weigh the module to the nearest .01 pound. Verify that the weight does not exceed the maximum allowable weight specified in paragraph 3.2.2.

3.1.11 Status and Caution Indicators. With a logic "one" applied to an input pin of J9 as specified in Table 3-2 and the input voltage set to 5.0 ± 0.1 VDC the corresponding status or caution indicator shall be illuminated at 15 ± 3 Foot - Lamberts. The exception shall be the COMP ACTY indicator, which shall be illuminated at 10 - 18 Foot - Lamberts with the 10K ohm potentiometer (ref paragraph 3.1.4) set to maximum resistance. Also a contact closure shall exist between pins of J9 as specified in Table 3-2.

3.1.14.4 High Marginal Voltages/High Temperature. The assembly shall perform as specified in paragraphs 3.1.4 and 3.1.6 thru 3.1.13 when the 25V supply is set to 30.0 ± 0.1 VDC, and the 14V supply is set to 16.0 ± 0.1 VDC, while the ambient temperature is maintained at $65^{\circ}\mathrm{C}\,^{+2.8\mathrm{C}^{\circ}}_{-0\mathrm{C}^{\circ}}$.

During marginal voltage and thermal extremes, no light intensity limits shall apply. Visual indication will insure system operation. The Keyboard shall not be energized at high thermal limits.

3.1.15 Vibration. The assembly shall perform as specified in paragraphs 3.1.4 thru 3.1.13 when subjected to the vibration limits specified below:

a. Frequency Range	10 to 2000 to 10 cps
b. Frequency Sweep Rate	at a logarithmic rate of one minute per octave.
c. Velocity	1.83 ± 10% inches per second in the frequency range of 10 to 100 cps.
d. Acceleration	3 g's ± 10% peak in the frequency range of 100 to 2000 cps.
e. Planes	each of the three mutually perpendicular axes.

3.1.15.1 Switch Chatter. During vibration there shall be no evidence of Keyboard switch chatter as specified below:

Key Lines - No contact closures of more than 50 usec duration.

Key Reset - No contact opens of more than 50 usec duration.

3.1.16 Leak Rate. With the assembly pressurized to 2 psig at 70°F using a mixture of 90% nitrogen and 10% helium, the leak rate shall not exceed 1.0×10^{-4} cc/atm/sec.

3.2 PRODUCT CONFIGURATION

3.2.1 Drawings. The configuration of the assembly shall be in accordance with Apollo G&N Drawings 2003950 and all drawings and engineering data referenced thereon.

3.2.2 Weight. The assembly shall weigh not more than 16.5 pounds.

4.1.1 Nonconforming Units. Failure of the unit to pass any examination or test of this specification shall automatically classify the unit as nonconforming. Each nonconforming unit corrected by the contractor shall be reinspected. Reinspection may be limited to the test or examination which defined the nonconformance, or, when directed by the cognizant inspector, a complete retest and re-examination may be required. Nonconforming units which have not been corrected will be considered for acceptance only upon formal application by the contractor to the cognizant NASA representative.

4.1.2 Test Conditions

4.1.2.1 Environmental. The assembly shall be tested under the following ambient conditions:

a. Temperature: 25° ± 10°C

b. Relative Humidity: 90% max

c. Barometric Pressure: 28 to 32 inches Hg

4.1.2.2 Module Case Ground. The dynamic tests specified in sections 3.1.18 thru 3.1.27 shall be conducted with module pin 68 connected to case ground (0 VDC).

4.2 TESTS

4.2.1 Drawing Compliance. The module shall be visually examined for compliance to the requirements of APOLLO G&N Drawing 2003952. Particular attention shall be given to inspection for damage to surfaces, structure, and equipment, including contaminants, pin misslignment, and legibility and appearance of marking.

4.2.2 Thermal Conditioning. Verify that the module was subjected to two complete thermal cycles as specified in paragraph 3.1.1 prior to performing the acceptance tests specified herein.

4.2.3 Continuity. Verify that the resistances measured between module pin 68 and chassis complies with that specified in paragraph 3.1.2. Anodizing may be penetrated to assure good electrical connection.

4.2.4 Insulation Resistance. Using test equipment with a test potential of 500 VDC limited to a short circuit current of one milliampere, measure the resistance between pin 68 and every other module pin. Verify that the resistance complies with that specified in paragraph 3.1.3.

4.2.5 Insulation Resistance.- Pin Group A. Using test equipment with a test potential of 500 VDC limited to a short circuit current of one milliampere, measure the resistance between the module pins specified in paragraph 3.1.4. Verify that the resistance complies with that specified in paragraph 3.1.4.

4.3.1.3 High Marginal Voltage/High Temperature. Set the ambient temperature and the input voltages as specified in paragraph 3.1.28.3. Verify that the module performs in accordance with paragraph 3.1.28.3.

4.3.2 Vibration. Install the module in a DSKY. Subject the DSKY to the vibration tests specified in paragraph 3.1.29. Verify that the DSKY meets the requirements of the applicable specification.

4.3.3 Weight. Weigh the module to the nearest .01 pound. Verify that the weight does not exceed the maximum allowable weight specified in paragraph 3.2.2.

5. PREPARATION FOR DELIVERY

5.1 GENERAL. Preparation for delivery shall be in accordance with Specification ND 1002214.

6. NOTES. None.

3. REQUIREMENTS

3.1 PERFORMANCE. The Indicator Driver Module is made up of a relay matrix, and relay control and driver circuits. The control and driver circuits govern the operation of the relay matrix. Energizing relays within the matrix allows the display voltage from the power supply to be routed through the relay contacts to various segments of the DSKY electroluminescent indicators.

3.1.1 Thermal Conditioning. The module shall be subjected to two complete thermal cycles, as specified below prior to acceptance testing:

> 25°C down to $-10^\circ C \pm 3C^\circ$ in not less than 20 minutes, held at $-10^\circ C \pm 3C^\circ$ for not less than 30 minutes, raised to $70^\circ C \pm 3C^\circ$ in not less than 40 minutes, held at $70^\circ C \pm 3C^\circ$ for not less than 30 minutes, lowered to 25°C in not less than 20 minutes.

3.1.2 Continuity. The resistance between pin 68 and chassis shall be 0.5 ohms maximum.

3.1.3 Insulation Resistance. The insulation resistance between pin 68 and all other pins connected together shall be 100 megohms minimum.

3.1.4 Insulation Resistance - Pin Group A. The insulation resistance between each pin in the group listed below, and all other module pins not included in this group, shall be not less than 100 megohms.
